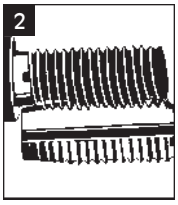
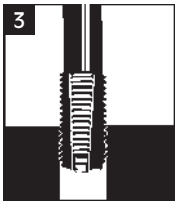
SEZIONE 01

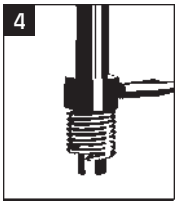
### FORATURA
Eliminare il filetto danneggiato con una punta normale. I nostri kit includono punte fino a M12. Nella sostituzione di una candela non è necessario eseguire la preforatura se si usa lo speciale attrezzo combinato per foratura e taglio. Nota bene: per i maschi per laminazione sono necessari fori più grandi.



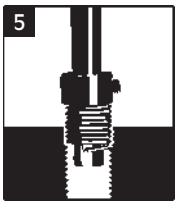
### CONTROLLI
Verificare che il maschio e il bullone abbiano lo stesso filetto e lo stesso passo.



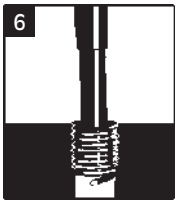
### FILETTO
Utilizzando gli speciali maschi V-COIL, tagliare il filetto di presa nel foro preforato. E' consigliabile l'uso di olio da taglio adeguato.



### INTRODUZIONE DELL'INSERTO FILETTATO
Porre il filetto sull'attrezzo di inserimento e posizionare l'anello regolabile in modo che il perno di trascinamento si incastri nella sede dell'apertura.



### INTRODUZIONE DELL'INSERTO FILETTATO
Avvitare quindi con una leggera pressione verso il basso fino a mezzo giro sotto la superficie. Non avvitare in senso opposto al filetto per evitare rotture del codolo



### ELIMINAZIONE DEL CODOLO
Una volta terminato l'inserimento del filetto, estrarre l'attrezzo di inserimento ed eliminare il perno di trascinamento con l'attrezzo rottura codolo. Nel caso di grandi dimensioni e di candele utilizzare pinze lunghe per rimuovere il codolo. Grazie alle tolleranze ridotte e precise, il nuovo filetto risulta normalmente più forte dell'originale.

**Applicazioni**
**Rivestimento del filetto.** Per materiali teneri, per es. Le leghe di alluminio e di magnesio. Utilizzati nella costruzione di macchine, nel settore elettrico, automobilistico, medico ed aerospaziale. **Riparazione di filetti** danneggiati o usurati. **Recupero di pezzi di scarto.**

## Filetti riportati

- I filetti V-Coil, costruiti con acciaio inox al nichelcromo, sono filetti interni estremamente robusti, resistenti a gli effetti delle temperature e della corrosione.
- Il design unico garantisce filetti di qualità superiore le cui prestazioni combinate non sono imitabili da nessun altro metodo di fissaggio singolo.
- Disponibili in due formati, a scorrimento libero o autofrenanti, i filetti V-Coil sono molto più leggeri e convenienti di qualsiasi altro tipo equivalente di filetto riportato.

**Filetti a scorrimento libero - "free running"**
Prodotti da profilato di precisione in acciaio inox austenitico avvolti e spirale elicoidale, i filetti riportati V-Coil hanno l'aspetto di una molla. Una volta inseriti usando un attrezzo a scelta da una selezione di utensili manuali o automatici, essi sono filetti permanenti interni resistenti al calore e alla corrosione. Quando sono posizionati, la loro posizione è mantenuta dall'azione della pressione radiale tra le bobine e i fianchi del foro filettato.
Queste pressione è data dal loro diametro libero che è maggiore, di una misura calcolata, rispetto al diametro installato.

**Filetti autofrenanti - "screw locking"** I filetti autofrenanti (o con coppia prevalente) sono particolarmente validi nelle applicazioni soggette a vibrazioni cicliche o a impatti. Oltre ai vantaggi garantiti dai filetti a scorrimento libero, i filetti autofrenanti V-Coil offrono inoltre la sicurezza della coppia frenante prevalente. Questo grazie all'azione di una o più bobine di presa poligonali collocate sulla lunghezza dei filetti che esercitano una pressione radiale sul filetto maschio. Ciascuna bobina di presa è composta da un numero di filature di blocco che sporgono entro il diametro inferiore delle normali bobine a scorrimento libero. Quando il filetto maschio passa attraverso queste bobine di presa, si spostano i locking flats, esercitando una pressione radiale o coppia prevalente sul filetto maschio. Rimuovendo il filetto maschio, le bobine di presa tornano alla loro forma originale permettendo il montaggio ripetuto mantenendo un livello misurabile di coppia prevalente.

Nota: con i filetti autofrenanti si raccomanda l'uso esclusivo di bulloni o viti close fit plated o lubrificati.

**Specifiche tecniche**
**I filetti riportati elicoidi VOLKEL sono realizzati, conformemente agli standard aeronautici, in Acciaio Inossidabile Austentico 18/8 DTD 734A (equivalente alle specifiche SAE AS 7245, DIN/NF 2947, W.Nr. 1.4301). Questo materiale offre una resistenza agli effetti di temperatura da -160°C a + 420°C (con picchi fino a 500 °C), alla corrosione e allo sfregamento.**
**Su richiesta è possibile fornire il certificato di conformità.**

**CARATTERISTICHE**

- misure: 10 x 11 mm (lunghezza 160 mm),
- estremità ad anello con cricchetto
- entrambi i lati con estremità snodata ad anello
- anelli apribili per inserimento su tubi
- una molla interna garantisce la chiusura dell'anello attorno al dado
- maggiore è la pressione esercitata nel senso di avvitamento, maggiore è la stretta della testa attorno al dado, prevenendo così lo scivolamento del dado stesso
- la chiave fa presa lungo il lato del dado, quindi funziona anche con dadi dagli angoli danneggiati
